

Database Attributes:

We will be using the following database attributes from the Slack API response:

1. UserName (Slack username) – To get information of the slack user
2. UserId (Slack user id) – User id of slack user who posted the message
3. Message text (Text contained in message)
4. Message Date and Time (Date and time string)
5. Channel Name (corresponding channel name to which message belongs) – Channel name could help in identifying the priority of message
6. Number of members in the channel – Shows how many members viewed the feedback, is also an indicator of severity.
7. Channel topic – More granular information about channel so that feedback could be put in right the bucket.
